

Management Utilities

Simplified Application and Patch Deployment

Discover, Identify Vulnerabilities and Deploy Seamlessly Across the Network ... Without User Interruption

Discover, Identify and Deploy

SyAM Software Management Utilities provide IT Administrators with the ability to quickly discover systems across the network, group and manage the systems, identify vulnerabilities in missing updates, and then easily deploy the required patches to ensure maximum security levels. The utilities work with System Area Manager and System Client software.

Management Features

SyAM Software management utilities contain the ability to:

Discover - systems across the network or Domain, identifying their key information, current power status, SyAM Software client version and type, Intel Active Management Technology (AMT) capability, and Domain information.

Group - the systems as you wish to manage their application deployment, giving you the maximum management flexibility.

Deploy - the SyAM System Client software quietly and seamlessly across the network to your group of systems without interrupting the user.

Identify - vulnerabilities in missing updates on each system, producing quick on-screen summaries and detailed csv formatted reports.

Patch - the systems seamlessly and quietly without forcing reboots or affecting users, enabling administrators to keep systems updated without having to schedule down time or evening updates.

Power Management - provides the administrator with group capabilities for configuring the power schedule settings, powering on, or shutting down groups of systems.
